

Electrocardiogram (ECG or EKG)

An EKG is a test that records the electrical activity of the heart. With each heart beat, an electrical impulse travels through the heart. This impulse causes the heart muscle to squeeze and pump blood from the heart.

An EKG will show the doctor if:

- The electrical impulse is normal, slow, fast or irregular
- The heart is too large or overworked
- There is damage to the heart muscle from a heart attack

Arrive on time for your test. The test takes about 15 minutes.

To Prepare

- Avoid using lotion the day of the test. The sticky pads, called electrodes, may not stick as well.
- Wear a shirt that buttons up the front for easy placement of the pads on your chest. You may wear a hospital gown.
